

Bosch Security Systems releases DSA-N2B40 iSCSI Video Storage Array Series, from the second generation of Bosch Video Storage Arrays engineered as part of the company's global partnership with NetApp.

The DSA-N2B40 assures max protection of recorded video with RAID-4 or RAID-DP technology. RAID-DP technology delivers uninterrupted system reliability even in the event of double-disk failures. Redundant hot-swappable power supplies and cooling fans provide additional safeguards from disk malfunctions. The system also features real-time health reporting and advanced warning of potential issues.

Designed as a scalable and easy-to-manage network solution, it enables users to easily add capacity when more storage is required—up to 96 TB. One base unit can be connected to up to 6 disk shelf expansion units to form a storage stack. Each stack is a single system to monitor and manage, requiring only one IP address.

Offering a lower cost-of-ownership than RAID-5 storage solutions, DSA-N2B40 Series features four gigabit Ethernet ports that enable up to 256 concurrent high-speed iSCSI connections. Like all Bosch/NetApp disk arrays, the DSA-N2B40 Series is fully integrated with the Bosch Video Recording Manager 2.0 software for faster setup. The Video Storage Arrays are also compatible with the Bosch Video Management System 2.x.
