File sharing startup Cloudtenna joins forces with NetApp in the co-development of intelligent file sharing hardware and software based on Cloudtenna's DirectShare.

Recently validated for use with NetApp Storage, DirectShare uses machine learning to enable smart features on top of enterprise storage technologies. It enables storage platforms to work directly with cloud SaaS applications, such as Microsoft Office Online, as well as providing smarter access, search and auditing for file services without migrating sensitive data to 3rd parties.

The combination of DirectShare and NetApp storage appliances also allows employees to remotely access behind-the-firewall filers from iPhone, Android and the web, share files and folders securely with external partners and clients, send files with no size limits and intelligently search and audit file services.

It also enables intelligent, Google-like search through millions of enterprise files, behind the firewall, to find best maches for individual users.

Go NetApp

Go Cloudtenna
