

Trend Micro Secures the Cloud

Written by Frederick Douglas
20 November 2019

Trend Micro launches a means to simplify hybrid and multi-cloud security-- Cloud One, a security services platform covering workload, container, file object storage, serverless and application, and network security, as well as security posture management.

According to the company, Cloud One allows customers to migrate existing applications to the cloud, deliver cloud-native applications and achieve cloud operational excellence. It includes a leading security service already in use by "thousands" of organisations, and is complemented by enhanced container security and offerings ensuring cloud infrastructure is optimally configured.

The all-in-one platform approach delivers simplified, automated and flexible protection, with a single sign-on for all services, common user and cloud service enrollment, visibility from a single console and a common pricing and billing model.

"We have been helping our customers with secure cloud transformation since the birth of the cloud, over a decade ago," Trend Micro says. "Customers have a mix of legacy servers,

virtualized data centers and newer services such as containers and serverless applications, and all of which can be protected using Cloud One.”

Cloud One is available from Q1 2020 with three fully integrated services, namely workload security, network security and application security. The other components will be available as standalone solutions in Q1 2020, before integration into Cloud One by end 2020.
