Security vendor Niara forms a partnership with big data platform provider Cloudera in the adding of the Niara Security Intelligence solution to the Hadoop-based Cloudera Enterprise data management platform.

In addition Niara Security Intelligence is tested and validated through the Cloudera Certified Technology Program.

“Today, it’s the threats that have gotten through traditional defenses that grab the headlines and are the hardest to find. Cloudera Enterprise is the ideal platform on which to build a solution that provides big data security analytics,” Niara says. “By aggregating and managing the massive depth and breadth of security data required to drive sophisticated behavioral analytics, Niara not only unearths these attacks but accelerates the investigation and response as well.”

Niara Security Intelligence has a number of features, including behavioural analytics, accelerated incident investigation and response, more efficient SoCs and both automated and human-driven threat hunting. It is available in cloud and on-premises deployments.
