

HP, Symantec Team Up in DRaaS

Written by Marco Attard
21 November 2014

HP and Symantec form a partnership in the name of a Disaster Recovery-as-a-Service (DRaaS) solution, one running on an HP Helion OpenStack-based cloud environment with HP providing the end-to-end service.

In turn Symantec provides the DRaaS solution. It supports replication, recovery and automated failover/failback of client IT, whether it is on-premises, managed cloud, private cloud or public cloud. It also handles and addresses specific disaster recover standards, such as PCI in the retail industry or HIPAA in healthcare, as well as recovery SLAs for systems and applications.

"This collaboration will help our customers to protect their workloads no matter if they run on traditional IT or are hosted within HP Helion OpenStack-based cloud environments," Symantec says. "This new DRaaS solution focuses on business continuity, failover and failback and will monitor the most widely used applications and databases in the market."

The HP/Symantec DRaaS solution will be available on a global basis in late 2015.
