The Ingram Micro Cloud Marketplace gets another product in the shape of the IBM SoftLayer cloud service, with access to virtual and bare-metal servers as well as security services and networking.

Customers can deploy such services on demand with full access and control through web portal or API, allowing the creation of public, private or hybrid cloud environments. The SoftLayer IaaS platform runs on datacentres across Europe, the Americas and Asia Pacific, and covers a range of cloud computing options connected to an integrated private network and management system.

Channel partners can configure and manage SoftLayer and other cloud offerings through a single console. The Ingram Micro cloud offering also taps into IBM in-country compliance efforts, providing regional customers with a secure, resilient and scalable cloud platform.

"With SoftLayer in the Ingram Micro Cloud Marketplace, it is easier and faster for organizations to adopt in-country compliant cloud services that drive business innovation and transformation," Ingram Micro says. "We're committed to developing additional services for workload migration, capitalizing on our professional services capabilities."

The SoftLayer is currently available through the Ingram Micro Cloud Marketplace in the US, before eventual expansion in European markets including Belgium, France, the Netherlands and the UK, among others.
