

Dell and Cisco Extend CI Partnership

Written by Alice Marshall
25 April 2019

Dell and Cisco announce the extension of a decade-long system integrator agreement-- one that sees the two companies share product roadmaps and collaborate on "strategic development activities."

The pact pushes converged infrastructure (CI) solutions based on technologies developed by Cisco and what was then EMC together with VMware back in 2009. One result of the alliance is the VxBlock 1000 technology stack bringing together Cisco compute and networking and Dell EMC storage and data protection. Most recently the VxBlock 1000 got support for the Cisco 6454 fabric interconnect, as well as a broader range of Cisco M5 server options.

"Cisco is committed to the partnership with Dell EMC and to jointly delivering innovative solutions for our VxBlock customers," the company adds. "By extending this agreement, we are continuing to provide powerful and integrated technologies with Cisco UCS, Nexus and MDS and delivering on our commitment to innovation for VxBlock."

Dell EMC also teases more news regarding VxBlock in the near future, perhaps at the upcoming Dell Technologies World or Cisco Live US.
