Ashton Bentley's New Connect 70 at ISE

Written by Bob Snyder
26 January 2014

Ashton Bentley extends its Connect Presentation and Videoconference system in time for ISE 2014 with the addition of models featuring 70in displays.

The first addition is the **Connect 70**, a single display model using an Edge Lit LED Deep Colour Display.

It is a fully complete A/V environment for presentations and videoconferencing that is aims to be a "convenient and cost-effective alternative to the traditional complex multi-vendor installation approach".

When partnered with a user's chosen camera and codec (it accommodates all leading PC-based software and hardware codecs), the Connect 70 provides an immersive presentation and communications workspace that can be assembled and set to work in minutes with no skills, experience or tools. It uses TCP/IP remote management tools to provide realtime status monitoring, fault indication and control.

Other features include: video routing/processing; a stereo active bi-amplified loudspeaker bar; tool-less assembly; integration with third party equipment such as control/monitoring systems and peripheral devices; and custom finishes to order.
