

Bosch Security Systems reveals what it claims is a "revolutionary" take on conferencing at ISE-- DCN multimedia, a system using IP-based Omneo architecture within integrated devices complete with touchscreen.

The conferencing devices feature high-directive technology inside an sleek microphone, a built-in 2-way loudspeaker system, advanced audio settings and a capacitive touchscreen allowing users to share documents, retrieve and display presentations and access the internet.

Being IP-based, DCN multimedia provides installers with easier integration, installation and maintenance. It also allows for further expansion via Omneo and Dante audio products, as well as standards-based data encryption.

The application also allows users to access events and related data (such as agenda points, speaker names and presented documents) using a standard web browser on PCs, tablets or smartphones.

“With DCN multimedia, our customers are investing in a truly future-proof solution that can grow with our customer's needs,” Bosch says. “Its use of standard and open technologies combined with multimedia capabilities for an enhanced meeting experience makes it the right choice for today and tomorrow.”
