---

Barco announces a collaboration agreement with video conferencing vendor Vidyo, one allowing the integration of Vidyo technology into the TransForm C enterprise collaboration solution.

As seen at ISE 2015 the Barco collaboration system uses the Vidyo standard portfolio to convert native VTC streams into low-latency, HD-quality multipoint video conferencing images. Users can configure and display multiple, dynamic VTC windows on large display walls, integrate meeting room collaborations via the ClickShare one-touch screen-sharing solution and control source placement and size via TransForm C display management software.

The TransForm C UI runs on OverView OSV series video walls for high-end collaborations paces, as well as the OBLX system featuring the OverView KVD or OVD near-seamless LCD panels.

“We are excited to team up with Vidyo on this integration, leveraging our mutual strengths in networked visualization to create a collaboration solution that fulfills a critical need for robust video conferencing combined with state-of-the-art immersive visualization,” Barco says. “Our technologies seamlessly combine to provide a range of high-caliber presentation and collaboration solutions, offering the ideal fit for any company.”
