Freespace, Affordable Room Booking System

Written by Bob Snyder

No end user needs convincing that a room booking system would be helpful, but **Vision** would argue that-- until now-- they have been prohibitively expensive. Vision believes the price point of their new solution will create a mass market.

Freespace is a locked-down Android tablet with an app pre-loaded. It mounts on wall outside the meeting room and shows bookings for that room. (Or any other room in the building. One device can service one room or a cluster of rooms).

If you need to find an available room just walk up to the nearest Freespace to find and book an available room.

Freespace works with **Microsoft Exchange Server** and all setup is done in Exchange. That should overcome any possible push-back from network administrators who resist proprietary room booking systems because they don't want to load "foreign" software on their system.

An image area on the screen shows scrollable images such as company logo, promotional offers, or room images – whatever the end user needs, and images can be deployed centrally. The device can use Bluetooth to log occupancy of room/s for reporting.
