

Pexip Adds Fusion Technology to Infinity 11

Written by Marco Attard
04 December 2015

Collaboration software developer Pexip announces Infinity 11-- now with Fusion technology, a means to enhance Skype for Business or Lync when used by standards-based SIP or H.323 users.

Fusion kicks in automatically during video-based meetings using a mix of Skype for Business and legacy videoconferencing. Skype for Business users get the familiar layouts, participant listings and meeting controls, and are able to drag and drop Pexip Virtual Meeting Room (VMR) contacts into meetings to seamlessly merge meetings based on different technology.

Skype users appear as standard videoconferencing participants to legacy users, while content sharing capabilities allow the seamless sharing of presentations, documents and other content to all meeting participants.

In addition Fusion covers mobile device or web browser-based video users. If Infinity is used as a gateway or primary meeting platform Fusion applies technology elements to define and control how standards-based videoconferencing and other video-enabled clients (such as WebRTC or Infinity Connect) work when connected with Skype meetings.

"The Fusion technology completely removes the barriers that make video-based meetings between today's major technologies-- Skype for Business and legacy videoconferencing-- cumbersome and less intuitive for many," Pexip says. "Fusion makes meeting people simpler by making sure every user has a completely familiar meeting environment no matter which technology they choose to use."
