Vision have a new version of their **Freespace room booking system**.

In the same way you check your own calendar in Outlook, Freespace is an Android-based product that displays a meeting room’s calendar on a display outside the room.

The new version of the app has a revised interface which is more customisable, and now works

with Google Apps and any other app-based calendar system. Vision say the advantage of the app-based approach is they can push out regular updates and customise quickly.

One of the two new hardware flavours is the new “**Freespace Dongle**” [pictured], which is designed for conference and event centres where there are already large 1080P displays installed.

Integrators can retrofit the Freespace system to those flat panels to get the calendar content for each room on those screens.

In stock in June, the dongle goes for SSP GBP 588 / EUR 758 / AUD 1178
