Oblong Industries releases the Mezzanine 200 series-- a visual collaboration solution with a new Partner Kit designed as a packaged solution for huddle rooms.

The Mezzanine 200 offers a platform for global team collaboration in smaller connected spaces. The solution offers a simple dual-screen configuration, making it easy to deploy. It complements a variety of displays, TVC codecs and other hardware peripherals offered by partners, providing a full room solution to customers.

However, what Oblong says makes the Mezzanine 200 different is a bezel-mounted infrared gesture-tracking system adding a natural interface option for multiple simultaneous content streams. Users simply need to point the remote wand device on the screens to highlight, snapshot, move and scale important information on the fly.

The wand is but one interface option, as laptops, smartphones and tablets also have equal access to wirelessly control the workspace. A touch annotation system allows simultaneous annotations over multiple streams. Collaborators can annotate over graphics or live video, including live video feeds of analog whiteboards in other locations. Taking a snapshot of annotated content instantly creates a new asset, which is delivered directly to the workspace portfolio for later reference and download.

In addition, the Mezzanine 200 promises to be installable and fully operational within a day.
