Pexip announces its Infinity Fusion solution is now certified by Microsoft as a video interoperabiilty gateway for Skype for Business Server.

The company collaborated with Microsoft in the certification of the latest version of Infinity Fusion. It features a gateway mode, allowing VTCs to participate directly in Skype conferences. Fusion retains the native end-user experience, eliminating the need for expensive trainings and lowering the cost of implementation and management.

The software is designed for any size organisation, especially large companies and enterprises, and is scalable to accomodate any number of users in any number of locations. Version 15.1 is certified for on-premises Skype for Business Server 2015 deployments, and addresses the needs of many Microsoft customers.

Beyond core Skype for Business interoperability, Infinity Fusion offers a variety of deployment options, allowing it to scale to a large range of users and locations. It can be deployed on-premises, on a cloud (such as Microsoft Azure) or a combination of the two.
