

ISE 2020 is set to see Nureva debut a number of audio conferencing products, all featuring patented Microphone Mist technology filling the space with thousands of virtual microphones for "unparalleled" full-room pickup.

The technology, the company says, allows participants to be heard throughout the room regardless of location, direction faced or the presence of unwanted sounds such as HVAC sounds or keyboard tapping.

In addition, Nureva will continue to recruit distributors and resellers at ISE 2020. It also plans to engage with end users to discuss how its products can solve audio challenges. Nureva counts the likes of Google, Intel, MIT, VMware, Allstate Insurance and Deloitte as customers, and feedback should continue guiding the expansion of the audio platform.

Further expansion should come through the development systems both painless to implement and flexible enough to grow with the changing needs of organisations, as well as integration and bundling with complementary products and platforms and the growth of the patent portfolio

Nureva Conferencing Additions for ISE 2020

supporting Microphone Mist technology.

“ISE continues to be an important event for Nureva, and we are delighted to give attendees a first look at the latest additions to our expanding audio conferencing product line,” the company says. “The growing depth and breadth of our audio platform continues to address the needs of our expanding customer base for simple, reliable audio solutions that can be deployed throughout the organisation.”
