TrueConf plans to debut a number of video collaboration solutions at ISE 2020 with the highlight being TrueConf Group, a videoconferencing endpoint based on open standards complete with built-in MCU.

Promising to be designed for nothing less than the ultimate video collaboration experience, Group features a built-in MCU able to deliver high-quality video and premium audio quality. The solution goes in a bundle with AV devices able to equip any meeting room, regardless of size. It fits with the existing TrueConf ecosystem, and as such is fully compatible with video collaboration solutions from the company.

In addition ISE attendees will be the first to check out the new TrueConf video collaboration platform aiming to boost team productivity. The solution is aimed at enterprise users wanting to migrate from Microsoft Teams to a secure on-premises messaging platform without sacrificing collaboration. The TrueConf offering allows teams and groups to communicate quickly using any device from any location, hold multiple conversations with different teams at the same time and invite additional people to join discussions, among other features.
