At InfoComm, LG USA showed its premium video conferencing systems, introducing two new VCS models: the V5500 is a multipoint system capable of connecting up to 4 remote locations, and the V5000 is a one-to-one system connecting two locations.

Advanced features of these systems include user presence identification, one-touch dialing and simple camera angle switching. Compatibility with various external media devices and software applications enable VCS users to connect different types of displays, including televisions, desktop monitors and projectors.

LG wants to break away from the mold of complicated interactive communications to deliver everything is integrated into a single system of compact design.

Its broad compatibility with external media devices and software applications also enables users to connect different types of displays such as TVs, desktop monitors, and projectors.
