

TechLogix Intros SMP Collaboration System

Written by Marco Attard
07 April 2017

The TechLogix SMP is a table-top wired collaboration system one can describe as a presentation switcher, HDBaseT extender and display controller rolled into a single hub devices.

Part of the Show-Me series, the SMP comes in digital and analog + digital models. It provides a single all-in-one interface for meeting rooms, huddle rooms and other collaborative environments, with the table-top hub designed for quick installation and intuitive end-user use.

Connectivity comes through HDMI and VGA ports, while built-in control handles source selection, display on/off and display volumes. An IR learning window and power-over-twisted pair power circuit are included.

The table-top collaboration hub connects to a remote receiver via single twisted pair cable, and the system only requires power at the display end. All control commands are programmed, transmitted and output via CEC (for consumer displays) or IR.

The SMP is shipping now.
