Extron announces the CCI Pro 700-- a product the company describes as the first control system user interface optimised for conferencing, collaboration and AV control.

Designed to support the needs of conferencing environments while providing an intuitive room control interface, the CCI Pro 700 includes a 3.5-inch colour display, numeric keypad and backlit buttons. The display can show contact information, call directories and call status, while the buttons allow users to navigate trough custom lists and menus.

Included Extron System Templates provide a starting point for configuration, with downloadable GC Plus files complete with GUI layouts and sample system logic.

The CCI Pro 700 is configured using Extron Global Configurator Plus or Global Configurator Professional and GUI Designer software, and works in conjunction with any Extron IP Link Pro control processor. It operates using standard network infrastructure and is easy to install via ethernet cable.

The CCI Pro 700 is shipping now.
