Crestron announces the M-Series and B-Series at InfoComm 2019-- single display kits designed to address demand for a native Microsoft Team experience in a wider range of spaces within the consistent Crestron Flex user experience.

According to the two companies, the continued expansion of certified Teams devices reflects a deepening relationship, as well as a growing commitment to provide the full Teams experience to any meeting space, consistently and securely. The single display options allow more businesses to access the Teams experience in more space, thanks to BYOD connectivity.

Users can either access Teams with one touch to join from the touchscreen, or connect via USB to a personal device to use the system with any meeting software. The M-, B- and C-Series room systems integrate seamlessly with the AM-200 and AM-300, featuring AirMedia 2.0 wireless presentation technology. In turn the AM-200 and AM-300 connect with Flex systems connected to the Crestron UC Engine to provide a complete room solution complete with wireless presentation, integration with Crestron AirBoard whiteboard capture and additional wired connectivity options.
