

Aorora Multimedia Shows DXE-218 Splitter

Written by Frederick Douglas
12 June 2019

Aurora Multimedia announces the DXE-218-- an 8-port 4K60 4:4:4 HDMI PoE splitter the company says is the first ever to feature downscaling per individual output.

The unit includes capabilities such as individual CEC control, EDID management, hot plug detection and EDID reporting per output. All is done through the LAN port for full control and statistics of all ports.

In addition, the downscaling per port allows the use of 1080p screens on the same splitter with a 4K60 source. The DXE-218 has two input ports to select from to change content remotely. PoE simplifies cabling by eliminating all external power supplies. Depending on the network switch, the DXE-218 can even be power controlled remotely.

The DXE-218 is available now.
