

Extron Adds Video Mirroring to SMP 111

Written by Frederick Douglas
16 August 2019

Extron announces the Horizontal Video Mirroring LinkLicense Upgrade for the SMP 111 streaming media processors-- an upgrade enhancing and streamlining the recording of video and audio presentations.

Horizontal Video Mirroring flips video horizontally to support lightboard and other applications requiring reversal of the video image due to the presenter facing the camera while writing on a transparent surface.

"We are always looking for new ways to empower integrators to offer more efficient, cost-effective solutions, and Extron's Horizontal Mirroring LinkLicense for the SMP 111 does just that," Extron says. "This valuable LinkLicense streamlines the recording process by eliminating the need to manually flip the video in post-production, saving time and resources for institutions with lightboard applications."

The Extron flexible framework offers the option to add an Pro Series control processor and a TouchLink Pro touchpanel for an integrated, user-friendly recording solution. A free system
