SnapAV Adds RT-3100 Pakedge Router

Written by Frederick Douglas
07 November 2019

SnapAV announces an addition to the Pakedge networking line-- the RT-3100, a gigabit router designed to offer network performance, reliability and security for small business customers.

The RT-3100 delivers gigabit WAN-to-LAN throughput, customisable firewall settings, streamlined configuration and built-in BakPak remote monitoring for connected devices. The throughput provides solid performance for the growing number of bandwidth-hungry smart devices in homes and offices, while customisable VLAN and policy management enables more granular network traffic control, including traffic management between VLANs down to the individual device level.

BakPak remote management allows installers to manage and monitor customer network and connected devices, such as those for automation, lighting and entertainment. BakPak is license-free, and helps installers increase business efficiency and keep customers happy without needing to roll a truck.

The Pakedge RT-3100 is available now.
