

BlackBerry, Samsung, IBM Intro SecuTABLET

Written by Marco Attard
20 March 2015

BlackBerry and IBM join forces at CeBIT 2015 to present the SecuTABLET-- a "high security" tablet based on the Samsung Galaxy Tab S 10.5 (not BlackBerry's own Playbook) aimed at public sector and enterprise use.

The tablet features a combination of the Secusmart Security Card and IBM secure app wrapping technology, and can be seamlessly integrated in existing BlackBerry SecuSUITE infrastructure. It is currently undergoing certification at the German Federal Office for Information Security for VS-NfD (classified - for official use only) security rating.

“Security is ingrained in every part of BlackBerry’s portfolio, which includes voice and data encryption solutions,” Secusmart CEO Dr. Hans-Christoph Quelle says. “National and international government customers have entrusted their voice and data communications with the Secusmart Security Card for years. This same technology is what secures the new SecuTABLET. Working alongside IBM and Samsung, we have added the last link in the chain of the Federal Security Network.”

The SecuTABLET will be available by Q3 2015, and will be sold by both BlackBerry and IBM.
