

ClarioNET shows off its all-in-one mobile enterprise solution at CeBIT 2012-- allowing access and use of software or services on a server or PC using any internet-capable mobile device.

The software integrates 2 solutions-- a Server Gateway (a WebSocket server plus HTTP server, using and allowing computer and session management, server side directory sharing, etc) and the HTML 5 client (connects to Server Gateway from any WebSocket-enabled browser).

The company says the solution can forward multiple client connections to multiple remote hosts, while server-side administrators control all applications users have access to (and all related resources) from one place.

It works on Windows or Linux server backends, running pre-existing applications without need for modification. On the other hand the HTML 5 client requires no downloads, plugins or applets and works on all platforms (Windows, Android, iOS, Blackberry OS) using different browsers.

ClarioNET is currently looking for distributors and resellers, and can be found on the link below.
