Christie expands the Extreme Series high-performance LCD display lineup with the FHD493-XE-- a 49-inch display with an extremely narrow combined bezel width of just 1.8mm.

Designed for 24/7 applications, the FHD493-XE offers panel matching and Christie Phoenix EP compatibility. Panel matching for colour and brightness means each panel ships pre-calibrated, and when used in video wall applications they stay on the same colour-scale. Integrated electronics support video wall scaling up to a 10x10 configuration, and 4K multi-stream transport across up to 4 panels is also built-in.

Smart Light Control automatically adjusts the brightness of each panel across the video wall for uniformity and consistent performance for the life of the video wall. An OPS slot allows compatibility with the Christie Phoenix EP embedded processing solution. The Christie Phoenix EP installs directly in the FHD493-XE to process network sources, decode and manage video and data sources on multiple Christie panels.

The FHD493-XE meets ADA depth requirements with a Christie ML20 mount, making it ideal for video walls in public spaces or locations with limited space.
