Visix releases version 1.30 of the AvixTV Signage Suite enterprise digital signage platform, together with Connect Room Sign version 3.11, adding JSON and XML calendar types and improving device management.

AvisTV 1.30 adds Adjust Message and Adjust Layout workflows allowing users to edit text and media files in fill-in messages and layouts. The Administer Players screens displays version, last snapshot and last update, and can be used to reboot or shutdown players. Version 1.30 also adds enhanced SAML authentication to the AvixTV Manage CMS.

The AvixTV Design desktop content design app also sees improvements to the Delphi calendar data widget and synchronisation with the CMS. A Data-Mapped Text Choice widget allows designers to specify the text they want to display, based on data available from the source. A basic user scenario would be "show the floor name based on the room number, or show the name when the for name is not available."

Meanwhile Connect Room Manager version 3.11 has the addition of two read-only calendar types, JSON and XML. The console has new backup and restore functionality, and administrators can enter a room sign device shell without need to reboot the device. The release also includes an energy-saver mode, enhancements to the PIN feature and enhanced logging capabilities.

Both releases are available for download now.
