VuWall offers to help those on the front lines of the coronavirus (aka Covid-19) with the free download of the VuWall2 visualisation tool, allowing organisations to create a temporary video wall solution.

“In this time of crisis, coordination teams within municipalities, newsrooms, and healthcare facilities are actively monitoring the Covid-19 pandemic and managing response efforts. These decision-makers need to access all kinds of information in order to make fast decisions and share information with their colleagues and in some cases, the public,” VuWall says. “We hope that by offering our VuWall2 for no cost as a way to create a temporary emergency video wall control center, we can aid key organisations in managing this influx of data and help keep people informed. We want to assist as many organisations as possible, which is why we will be offering first come, first served setup and support.”

VuWall2 allows organisations to turn any screen-- such as PC or a large TV in a temporary emergency control center or waiting room-- into a command center. The software grants access to and integrates visual information from multiple sources in one screen, including web pages, computers on the network, IP cameras, local applications (Word, Excel, PowerPoint, etc) and even videoconferencing tools such as Zoom and Skype.

Customers can set it up on a PC or as a makeshift videowall with up to x4 displays. Operators can arrange the content source in any configuration required for better visualisation, and run a ticker for emergency messaging. They can also create various layouts, save them and recall them as the situation changes. VuWall says setup takes around 1 hour, and requires installation on the PC driving the display before it can be controlled from any computer on the network.
