NEC Display Solutions Europe presents a range of commercial-grade large format displays--the MultiSync C Series, ideal for use as digital signage displays or for presentations in smaller conference rooms.

The C Series displays come in 3 sizes, 43-inch (C431), 50-inch (C501) and 55-inch (C551). All models have a mechanical depth of just 45mm, and offer a modern design, HD images, 400 cd/m² display brightness and multiple inputs. An integrated media player allows auto content playback and management of image and video files without need for external cabling. As a result, the only external hardware required is a USB drive or MicroSDHC card.

Full external control is included through LAN and RS232 interface, enabling easy integration into existing control systems. One can install the C Series displays in both landscape and portrait orientation, expanding the available deployment options.

For the central control of multi-device installations NEC suggests its all-in-one remote control and management software suite, NaViSet Administrator 2. The C Series displays ship from December 2017, with more, larger sizes to launch in early 2018.
