EveryonePrint announces the subscription-based Hybrid Cloud Platform (HCP)-- an all-in-one cloud-based print platform for channel partners bringing a Software-as-a-Service (SaaS) model to printing infrastructure.

According to the company, the HCP allows customers to seamlessly migrate existing on-premise print environments to the cloud, allowing users to deploy and manage the entire printing infrastructure from a single web-based UI. Available as either hosted SaaS platform or an on-premises private cloud, the solution comes complete with full data encryption and built-in auditing to help customers protect data, track documents, manage risk and achieve compliance. Integration with cloud-based authentication providers enables role-based permissions.

A single print drivers allows every user to print to any device, include complex job attributes across a multi-vendor printer fleet. Embedded clients are also available for all major vendors for the secure release of print jobs from any MFP panel.

"HCP enables users to easily connect to the print infrastructure without needing IT support, significantly reduces print costs and eliminates the need to purchase, deploy and manage print servers," EveryonePrint says. "Furthermore, the Hybrid Cloud solution includes all the features and benefits from EveryonePrint's widely adopted mobile printing solution which enables printing from any mobile device."

The HCP is available now.
